

KnockOut 2

In KnockOut 2, you can feather jagged edges, and then reprocess the image. This feature lets you produce a softer, more natural-looking transition edge.

To feather the transition area

- 1 Click the **Edge feather** tool.
- 2 Drag around the edge you want to feather.

- 3 Click **Edit** ▶ **Process**.

Note

You can also add to or subtract from the area you want to feather by clicking the **Feather addition** or **Feather subtraction** button on the property bar, and drawing around the area you want to edit. Once a button is clicked, you remain in addition or subtraction mode until you click another button.
